# GCM BASICS

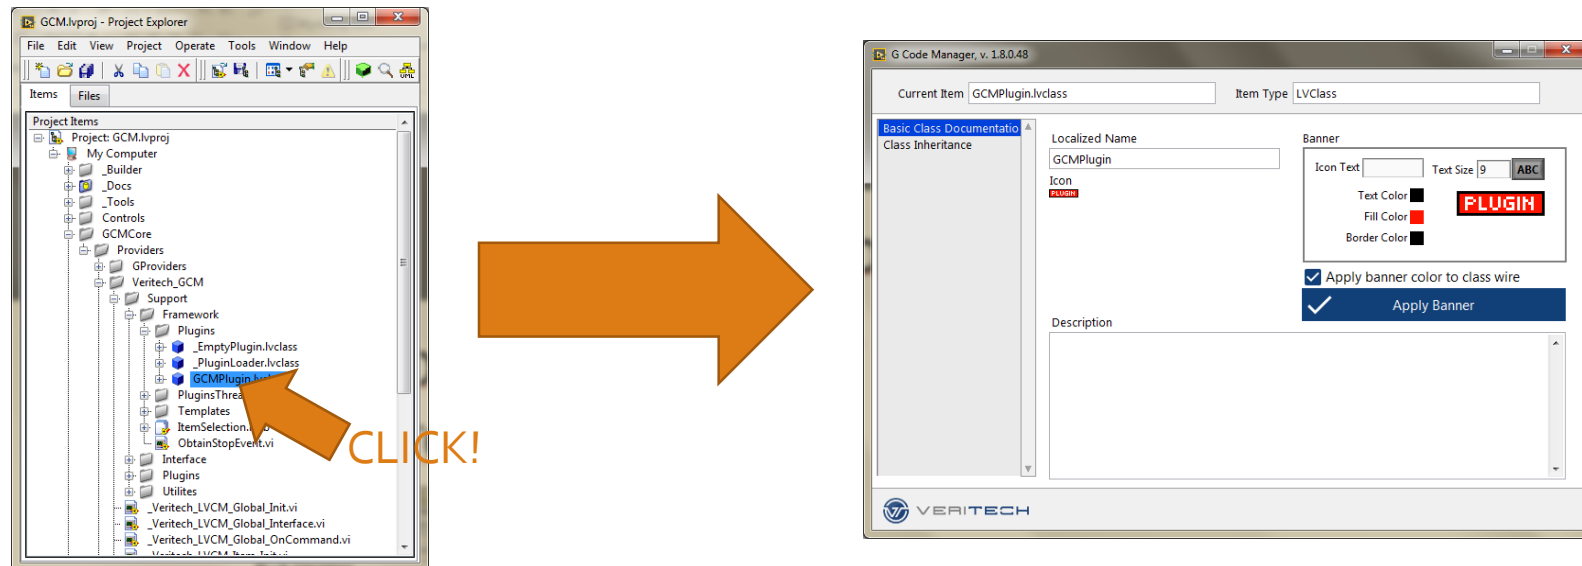

# IDEA

## To make common operations with LV Project Items more accessible

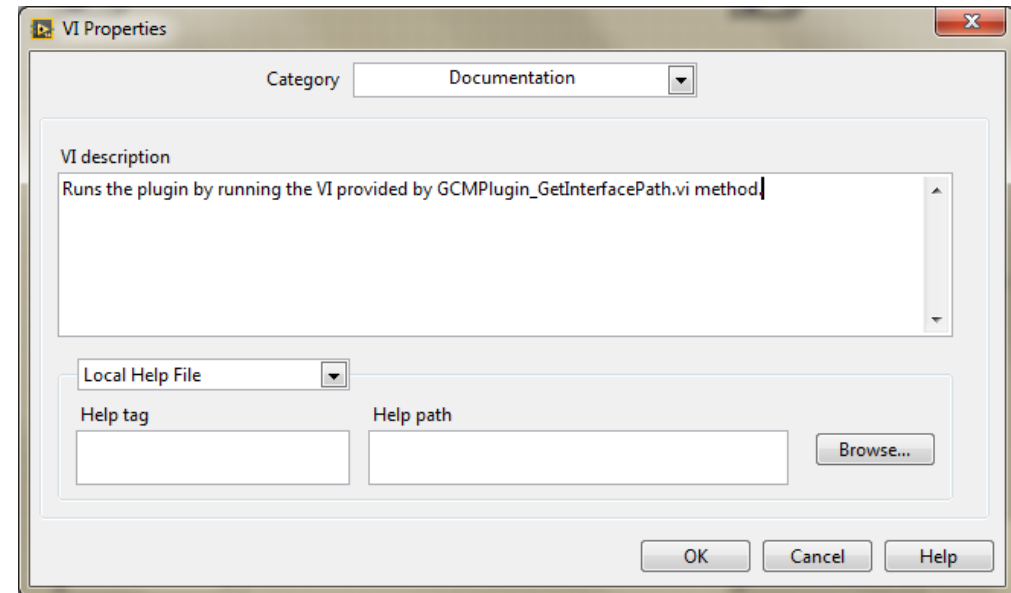

# HOW

- Immediate access to any properties, like icon, documentation, inheritance tree...
- Non-blocking windows
- Using Project Providers framework

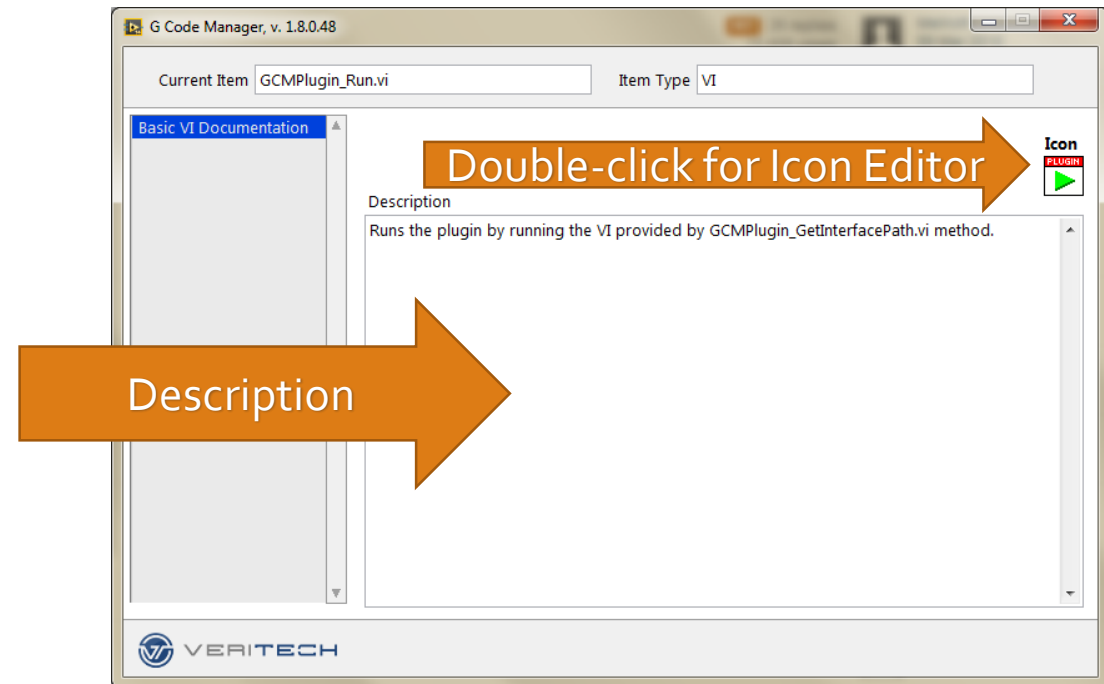

# WHAT

- Basic VI documentation
- The VI properties window is modal...

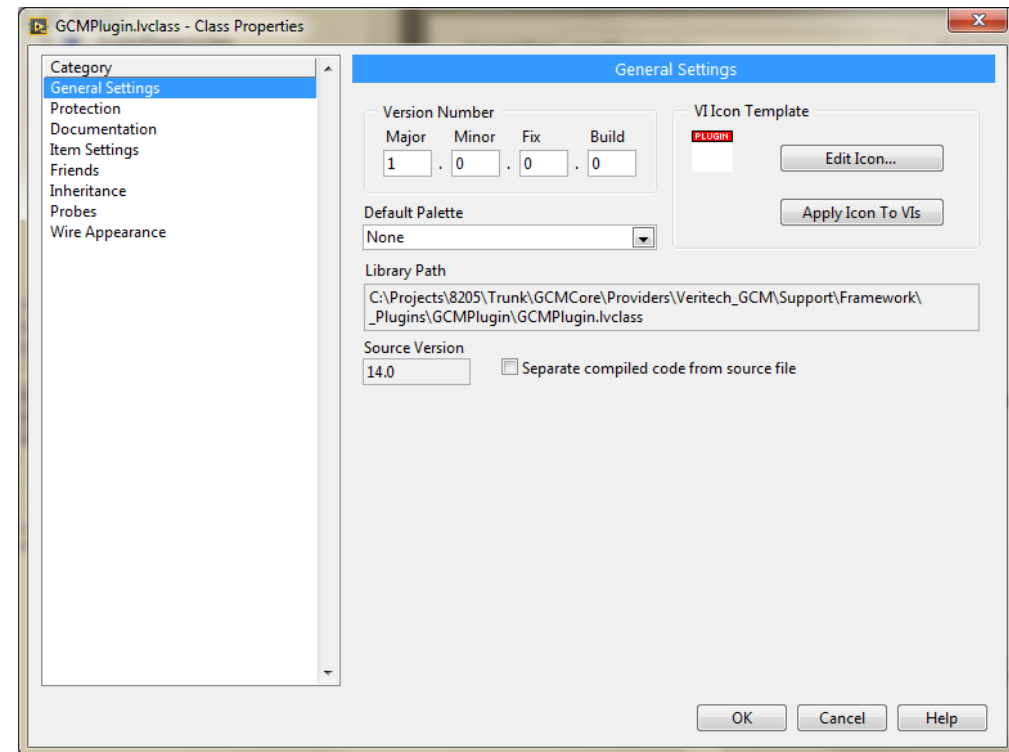

# WHAT

- Basic VI documentation plugin
- Available for VIs/controls
- Non-modal window!

# WHAT

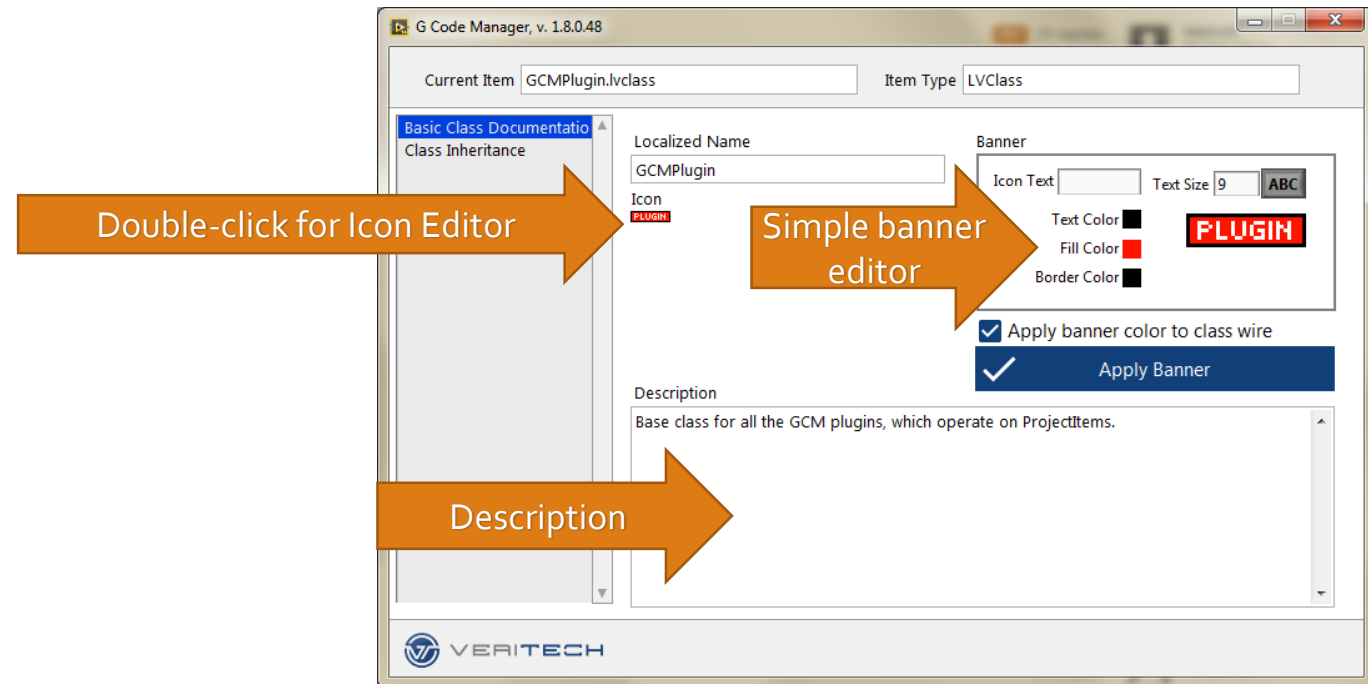

- Basic class documentation
- The class properties window is modal
- And it can take ages to load

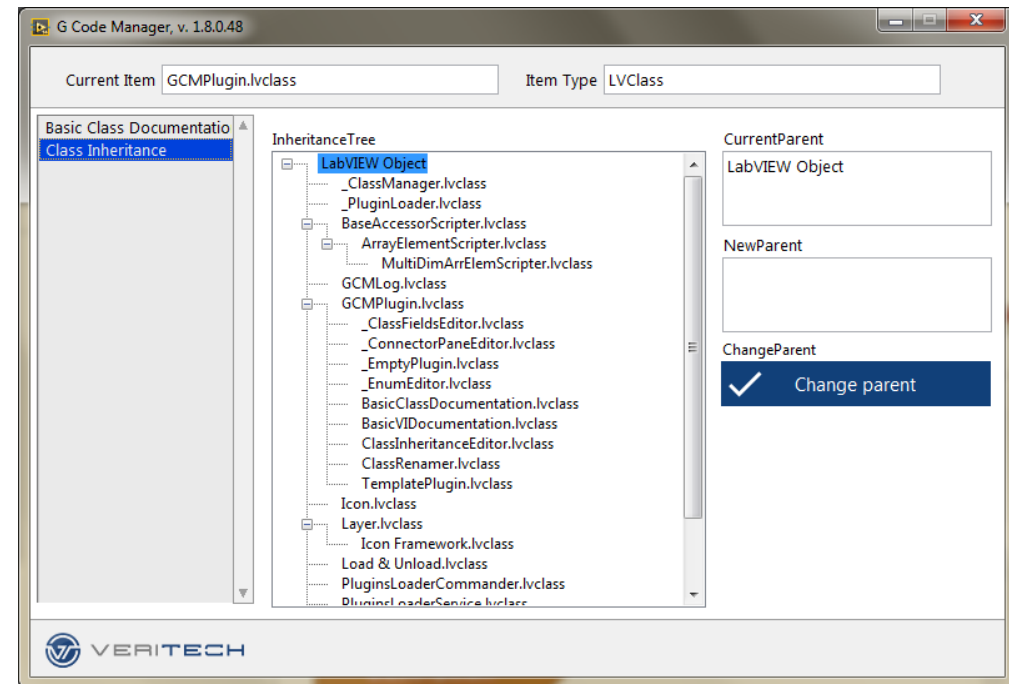

# WHAT

- Basic Class Documentation plugin
- Available for classes
- Non-modal window!
- No loading time!

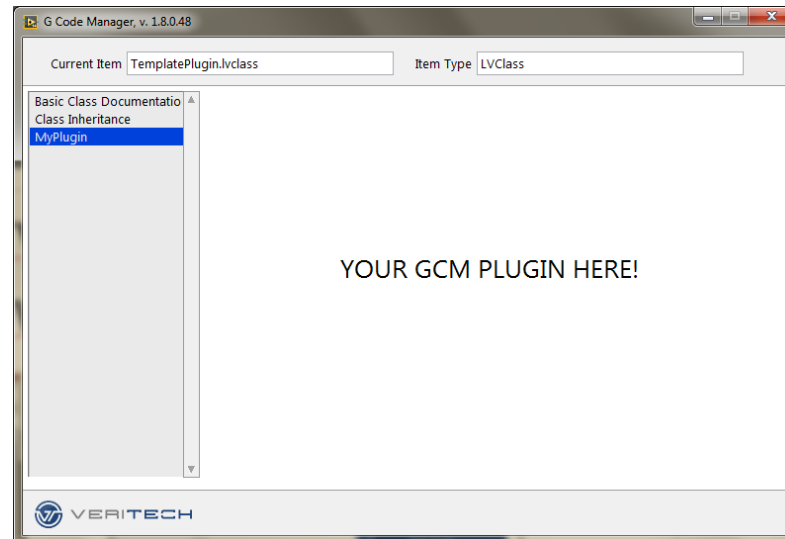

# WHAT

- Class Inheritance plugin
- Available for classes
- Non-modal window!
- **No loading time!**

# THE GOAL

To give everyone an easy way to  
customize their working environment

# THE FUTURE

- Stabilizing the core
  - This tool was made using some internal LV APIs which are not fully tested and documented
  - It is in very early stage when it comes to stability
  - **It may cause LV to crash!**
  - **I strongly advise using source control – if you're not using one, do not even install this tool!**
- Extending basic functionality
  - Mirroring most important items from VIs/Classes property windows
- Giving everyone the opportunity to add their plugins
  - Creating one-click tool to create the new plugin
  - Keeping the plugin API as simple as it is now

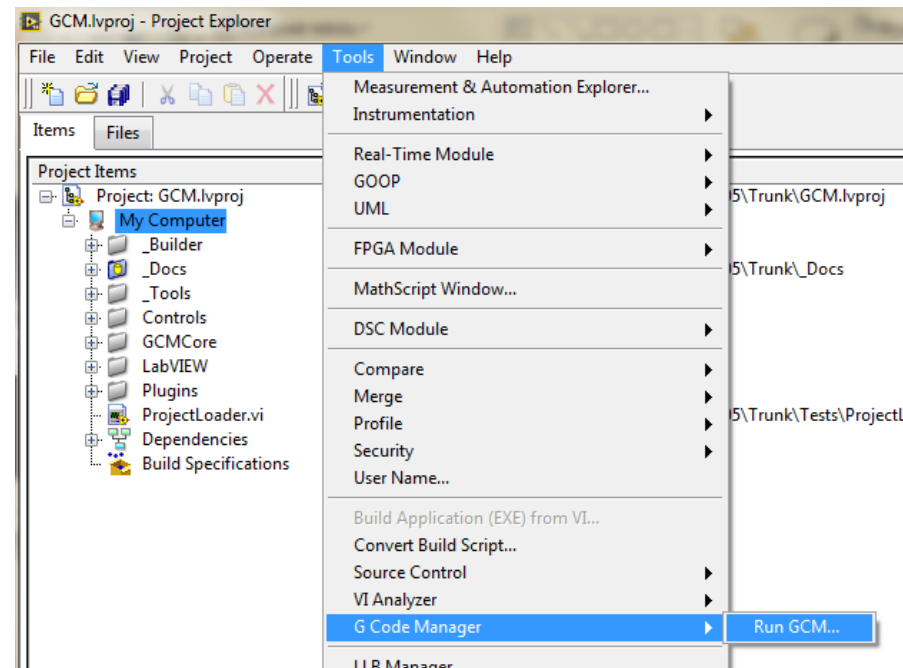

# QUICK START

# IMPORTANT NOTICE

- This tool was made using some internal LV APIs which are not fully tested and documented
- It is in very early stage when it comes to stability
- **It may cause LV to crash!**
- **I strongly advise using source control – if you're not using one, do not even install this tool!**

# OPENING GCM

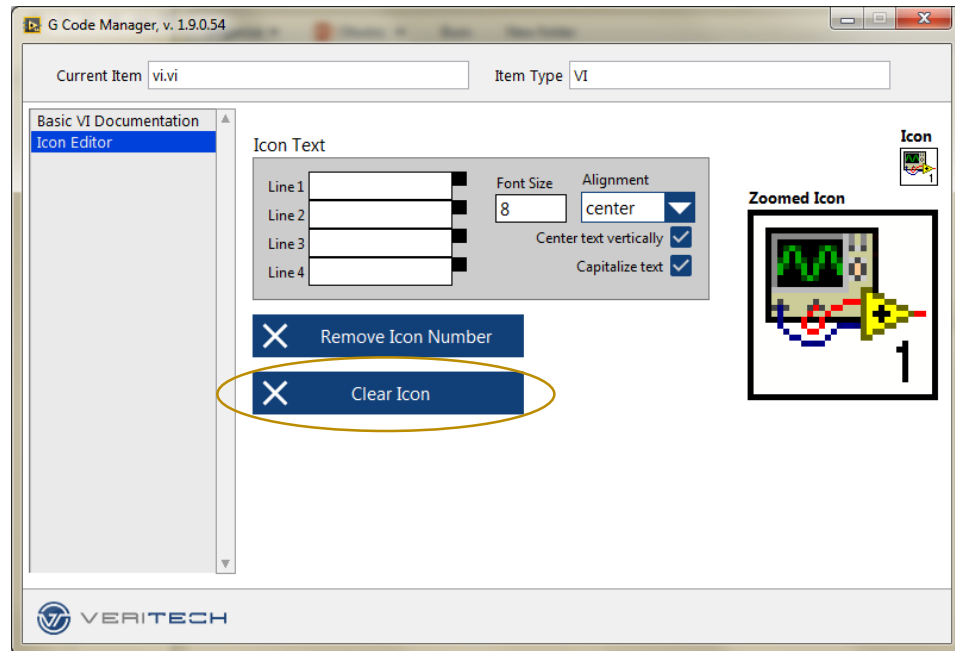

- In the Project Explorer window click on the **Tools** menu, then select **G Code Manager** -> **Run GCM...**

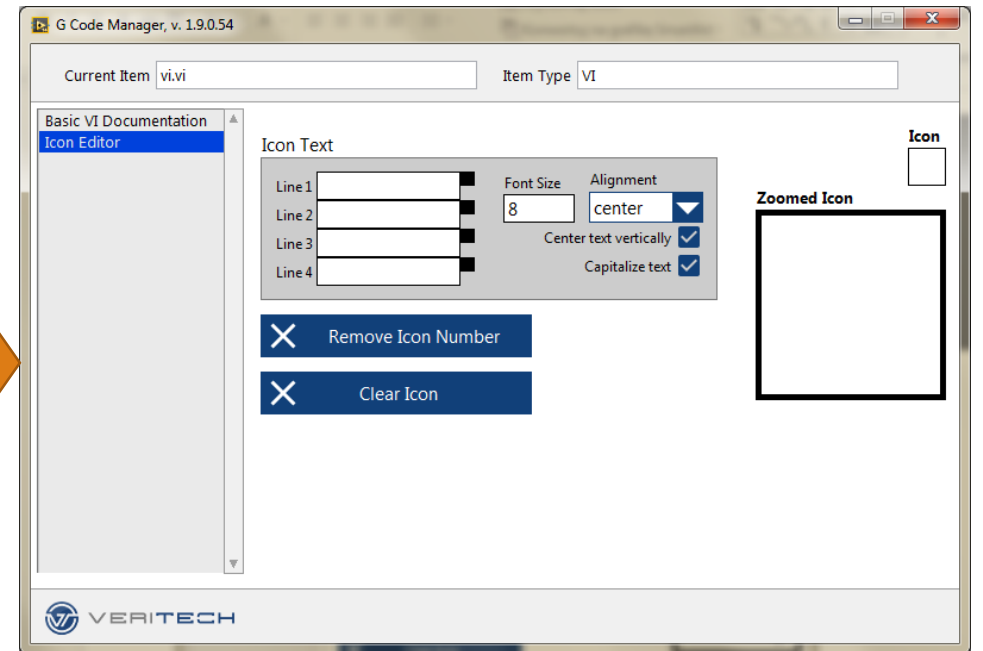

PLUGINS

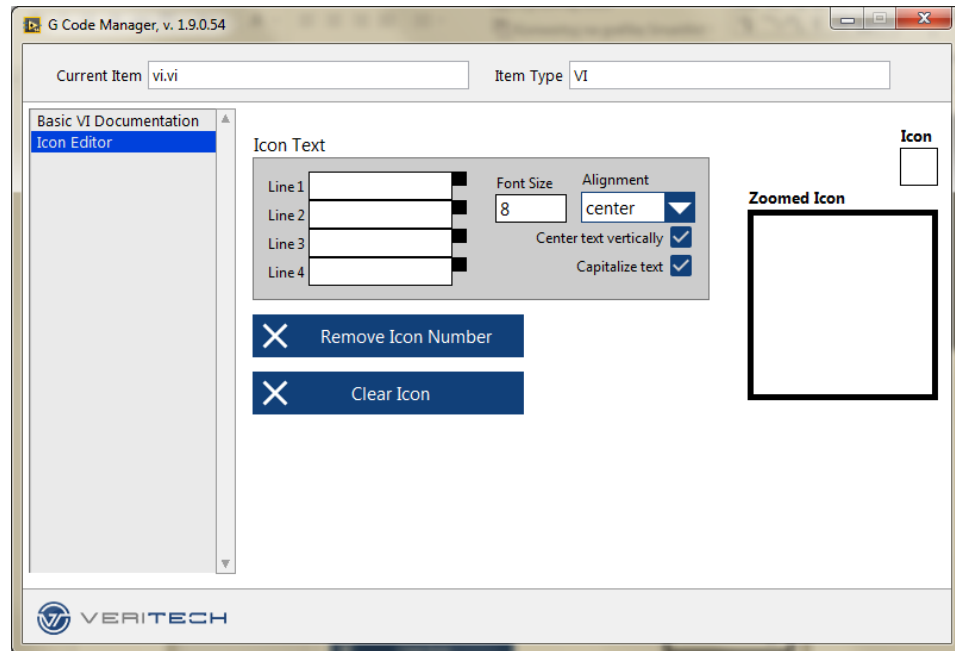

# ICON EDITOR – VI

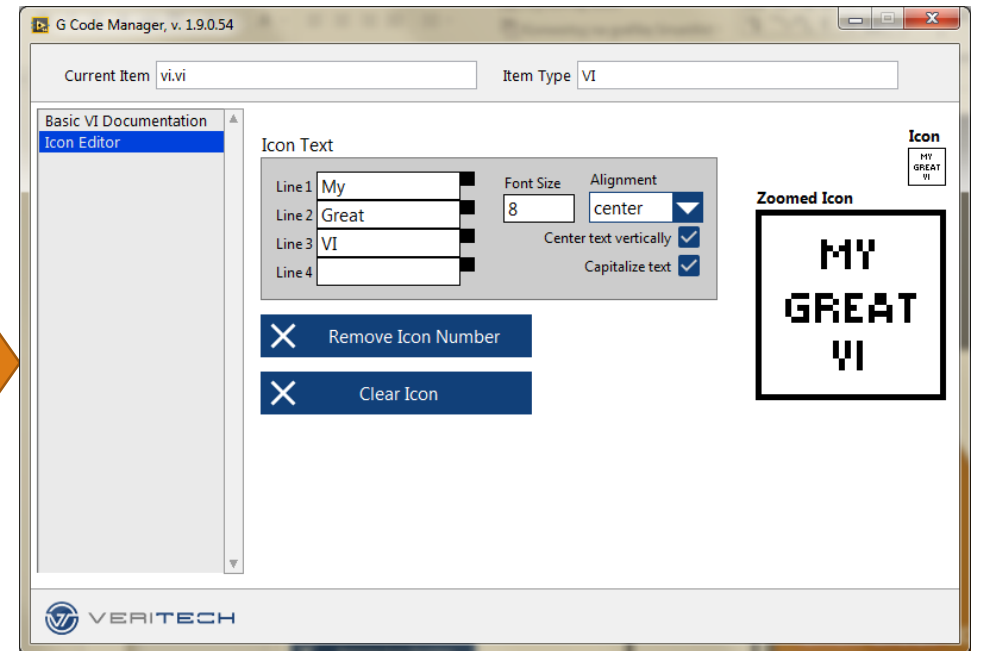

Click **Clear Icon**  
to remove  
current VI icon

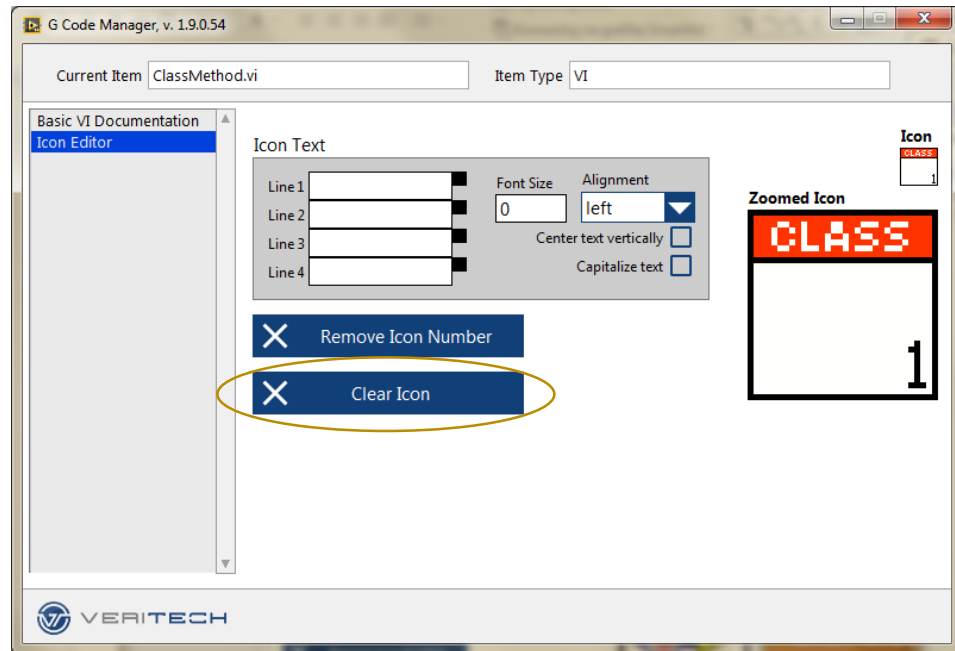

# ICON EDITOR – VI

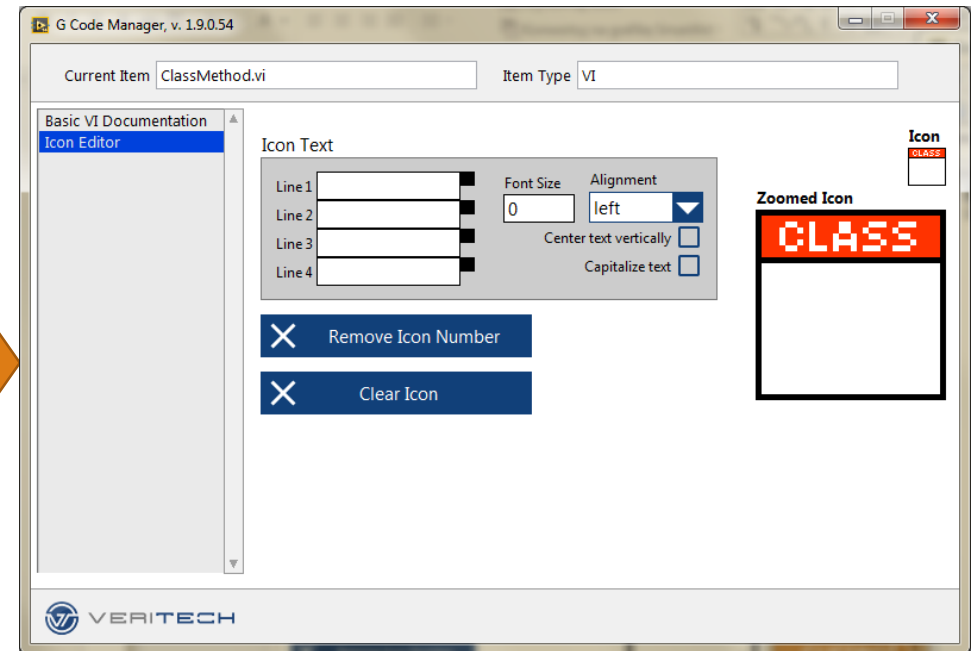

Edit VI text

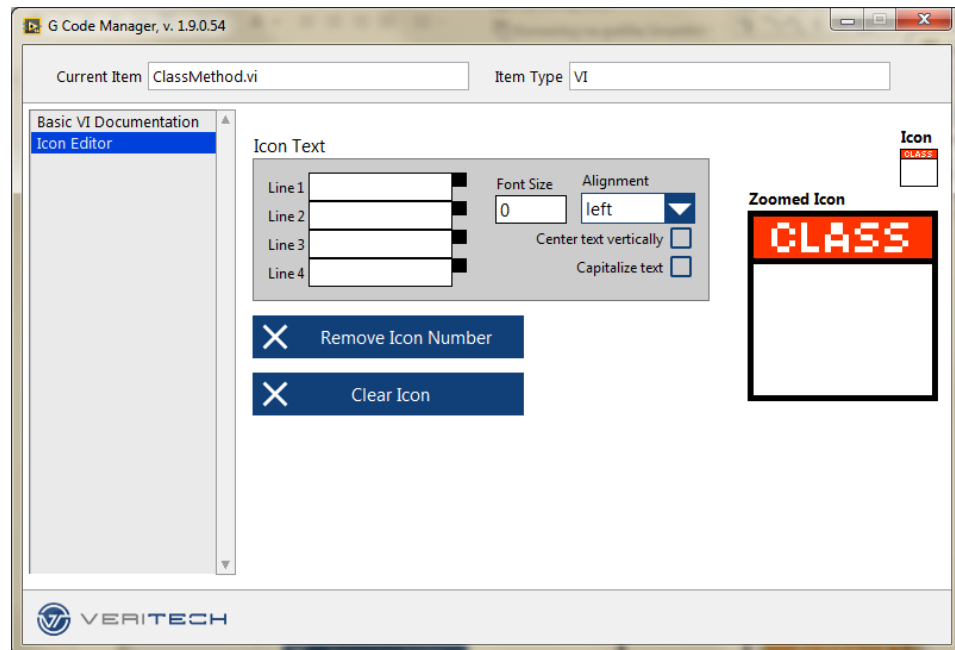

# ICON EDITOR – CLASS MEMBER VI

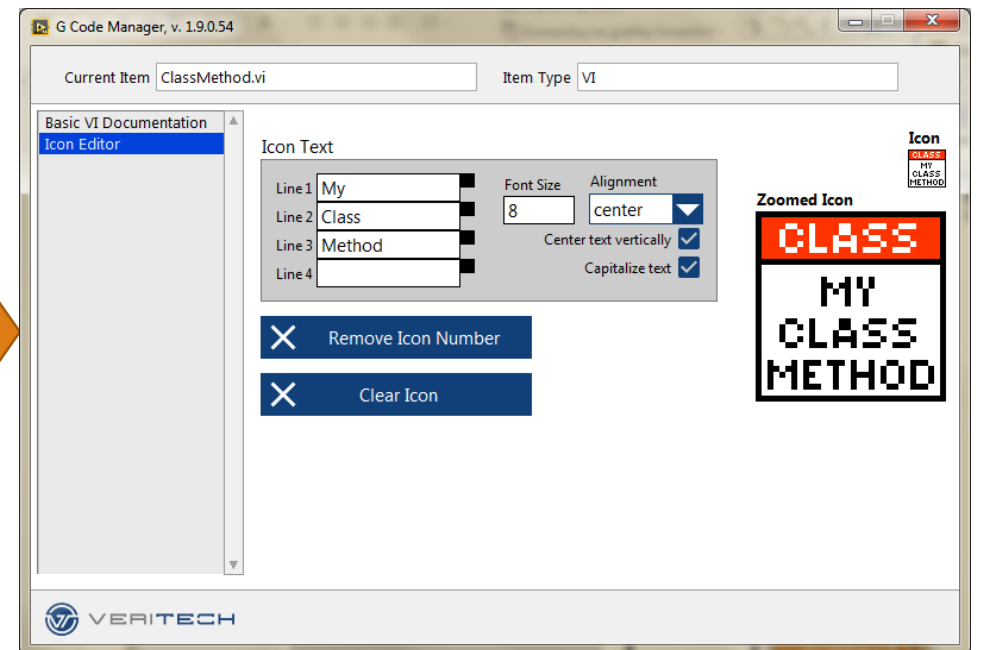

Click Clear Icon  
to remove  
current VI icon;  
the class banner  
(*NI\_Library* layer)  
will be preserved

# ICON EDITOR – CLASS MEMBER VI

Edit VI text

# CREATING PLUGINS

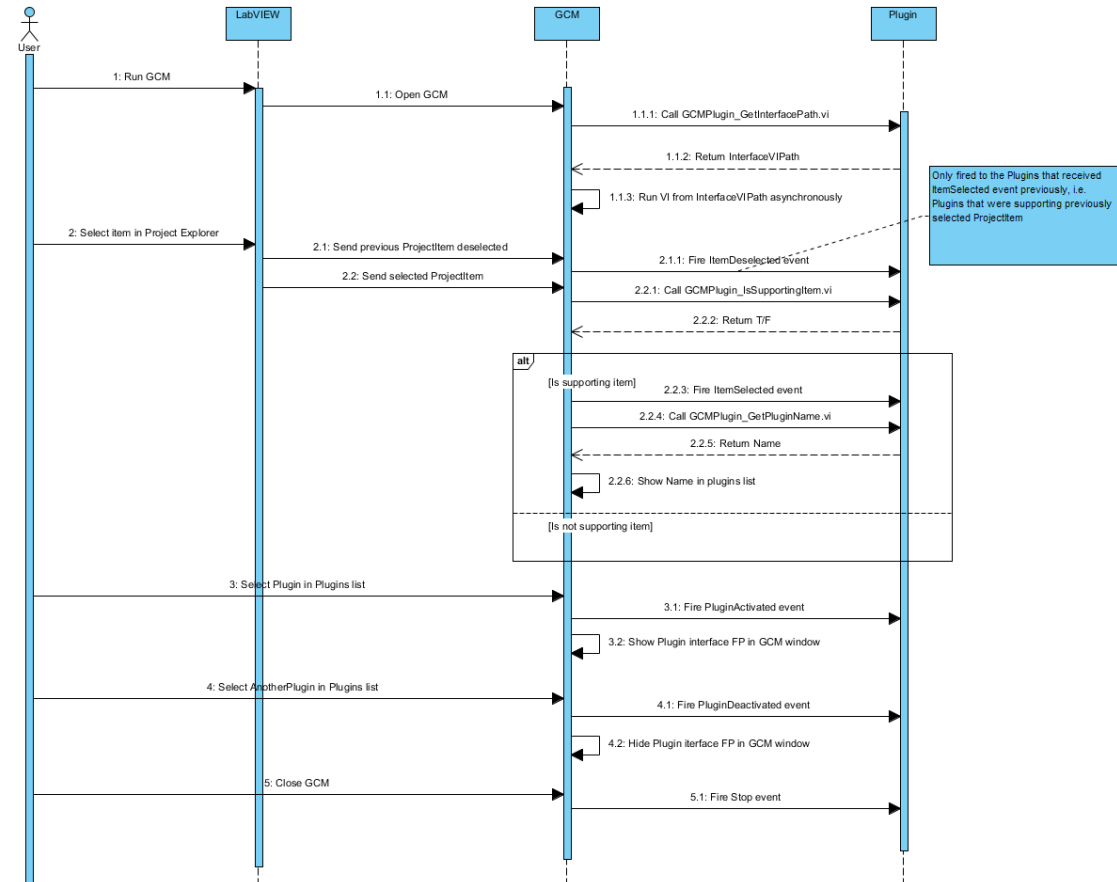

# YOUR OWN PLUGIN

- Create your own plugin: copy the template
  - From:  
<LV>\resource\Framework\Providers\Veritech\_GCM\Support\Templates\TemplatePlugin
  - To:  
<LV>\resource\Framework\Providers\Veritech\_GCM\Support\Plugins
  - Tip: do this from project window to preserve the dependency to GCMPlugin class (create new project, add TemplatePlugin, then copy it using right-click menu)
- Edit the plugin VIs, do whatever you want with your Project Items!
  - Interesting points are marked in bookmark manager with #GCMTemplatePlugin

# YOUR OWN PLUGIN

1. Edit **GCMPlugin\_GetPluginName.vi**, so it returns proper name for your plugin.
2. Edit **GCMPlugin\_IsSupportingItem.vi**, so it return True if the item is supported by your plugin
  - e.g. If your plugin supports editing VI description, you should check if VI Reference provided to IsSupportingItem.vi is valid.
3. Edit **GCMPlugin\_GetInterfacePath.vi**, so it returns the path to your plugin interface VI. GCM will show this VIs Front Panel when the plugin is selected by User.
4. Edit your Interface VI:
  - Check the #GCMTemplatePlugin tags
  - Refer to [GCM Plugin Workflow](#) to see when the events are fired.
